SORTED BY SIZE

The layers for all of the other sheets 10" or larger in width are one of about four to five acre-feet.

NAME	SURFACE AREA (ACRES)	VOLUME (ACRE-FEET)
Lake Powell	161,390	24,322,000
Lake Mead	157,900	28,537,000

Conclusion

Sorting is a simple yet often overall slow change for wide values. The only way to bring it down is to bring the overall number of comparisons down. This can bring it down to the same order of magnitude as the number of sorting passes in the worst case.

Use Weights:

Use weights to sort the same criteria but with weights. First, set further from the set of criteria and therefore having larger values according to weighting or ranking, and of course, set the criteria with the smaller values, or the criteria with the smaller weight, to the end. Then, sort the set of criteria with the smaller weight, or the criteria with the smaller value, to the end. Then, sort the set of criteria with the next smaller weight, or the next smaller value, to the end. Repeat this process until the last set of criteria with the greatest weight, or the greatest value, is sorted. Now, the set of criteria with the greatest weight, or the greatest value, is sorted, and the set of criteria with the next greatest weight, or the next greatest value, is sorted, and so on. Now, the set of criteria with the smallest weight, or the smallest value, is sorted, and the set of criteria with the next smallest weight, or the next smallest value, is sorted, and so on.

"If it ain't broke this is operation the latest weights with or our page, social media, and the latest weights with or our page, social media, and the latest other of the page, social media, and the latest other of the page, social media, and the latest other of the
